Minutes of meeting

Date: 05/09/2023

Group members attending the meeting: Claudiu, Angel, Danila, Nazim

Topics to discuss: Client Interview

Today we interviewed our project client. We had a conversation and the following statistics and requirements were listed:

Client Overview:

The client has a physical store.

They want to manage stock and update it within their software system.

Stock should be added, removed, and modified in terms of quantity and prices.

Stock levels should be automatically reduced when items are sold and restocked automatically when they reach 0 quantity.

There are two user groups: Admins and Employees.

Admins assign shifts to employees but do not manage stock.

Employees are responsible for managing stock.

Shifts are in three 8-hour periods: 12 AM to 8 AM, 8 AM to 4 PM, and 4 PM to 12 AM.

Managers (Admins) can see employee assignments and check shift details.

Managers can input extra pay for night shifts.

Stock management is the responsibility of employees.

Required statistics include: stock for every department combined, stock per department, and stock per item.

Use Cases for Website and Application:

Application (for Managers and Employees):

Employees use the application to manage the store's stock (add, remove, update).

Managers use the application to assign shifts to employees and oversee employee-related tasks.

Managers can view employee assignments, including shift details.

Managers can input extra pay for night shifts.

Both Admins and Employees can log in and log out for account management.

Website (for Clients):

Clients use the website to view products and make purchases.

The website serves as an online shop for customers.

Stock quantity is available with its price tag.

After the questions we talked about setting up a git repository. We asked who should be invited and if the customer interview should be added to it. Our teacher told us that only the client and tutor should have access to the repository and yes, this conversation should be in it.

In conclusion, the text presents a comprehensive overview of a project client's requirements and expectations for a software system aimed at managing stock and store operations. It highlights the client's need for efficient stock management, user roles (Admins and Employees), shift scheduling, and detailed statistics tracking. Additionally, it outlines the use cases for both the application (for Managers and Employees) and the website (for Clients), emphasizing their respective functions.
